

Milestone 2

Remari Hudson, Ryan Schultz, Mariah Weldon, Lance West, Malia Mitchell

20 June 2024

Scope:

The scope of this systems request is as follows:

- Development, implementation and validation of an automated recall management system
- Improvements to the current external quality agreement system

Background:

The new and improved systems will enhance the efficiency and quality of BD's infusion pump field action management systems, quality agreement practices and label management activities. The system scope called out above will ensure that accessories included in the product labeling are compatible with the pump throughout the product's life cycle.

Recently, BD issued a class 1 recall on the infusion pump labeling—the pump's compatibility list—because the labeling indicated that the pump was compatible with an external partner's syringe. However, the external partner changed the design of the syringe after the initial list was published. As a result of the external partner's design change, the pump and the syringe are no longer compatible. This incompatibility has led to product failures, delay of patient care, and a recall that has damaged the public's perception of the company.

System Features:

The automated recall management system (RMS) will identify the location of every impacted pump and deliver an automated message to every customer to take the following actions (reference <https://www.fda.gov/medical-devices/medical-device-recalls/becton-dickinson-bdcarefusion-303-recalls-alaris-infusion-pumps-due-compatibility-issues-cardinal>):

Stop use of Cardinal Health branded Monoject syringes with the BD Alaris Syringe and PCA Modules.

Replace the current BD Alaris Syringe and PCA Module Compatibility Lists with the updated compatibility lists attached to the letter.

Complete the Customer Response Form that was attached to the letter and return to the BD contact noted on the form to acknowledge receipt of this notification.

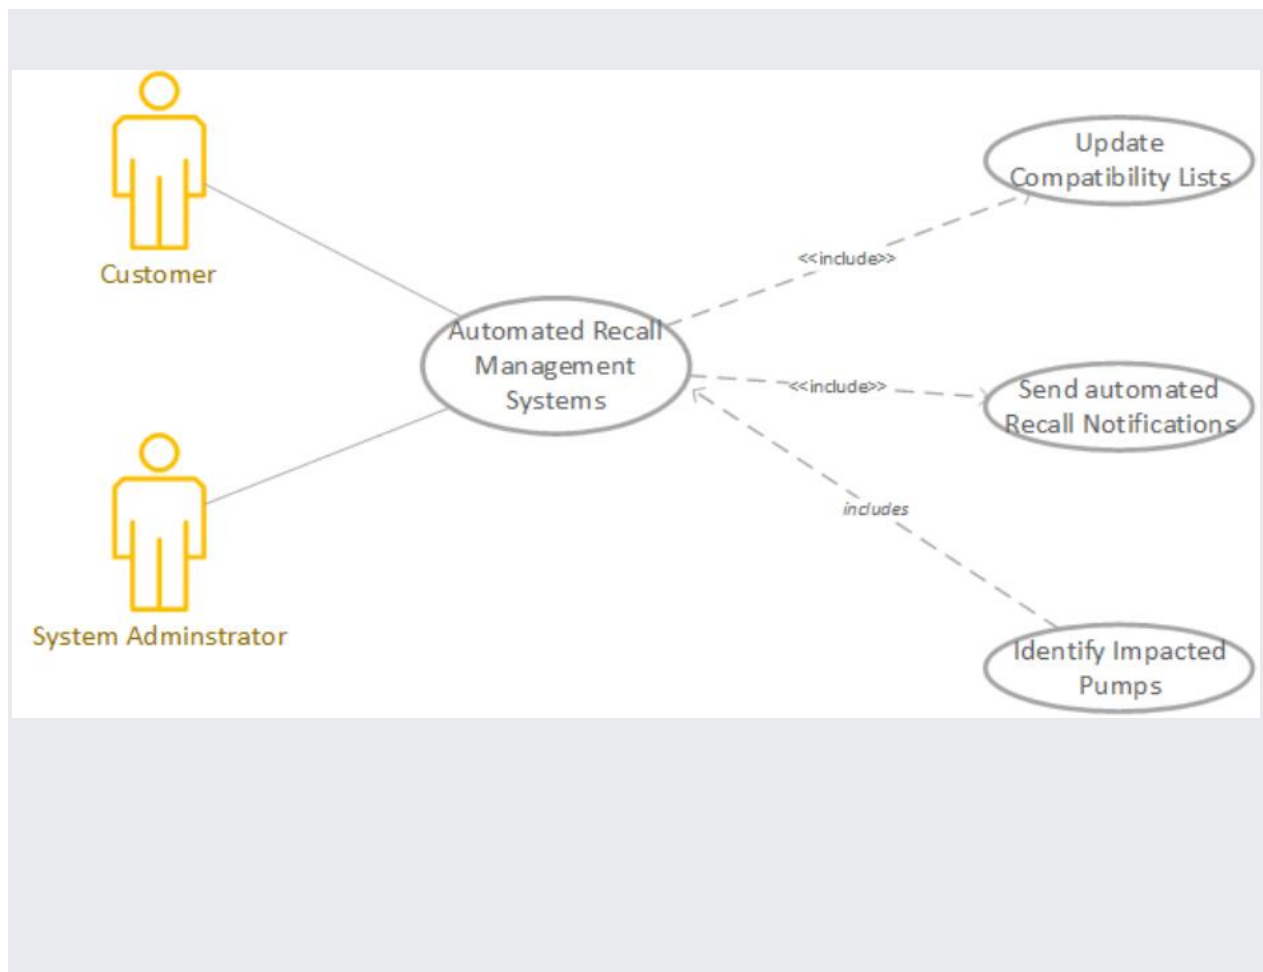

Additionally, the RMS will also create tracking reports so that the recall team can take additional action to obtain missing and delinquent customer responses.

The external quality agreement system (eQAS) modifications will include procedural and IT updates. Existing procedures will be updated to require the supplier quality team to assess external product design changes on a quarterly basis at a minimum. Additionally, the eQAS will also be integrated into the existing design control enterprise software such that both internal and external design changes are accessed via the same ways of working. Lastly, a new module will be added to the design control tool to prompt the users of missing and delinquent external agreements, to track the completion of tasks associated with the development and modification of the agreements, and to flag which compatibility requirements are at risk given the status of the external agreements.

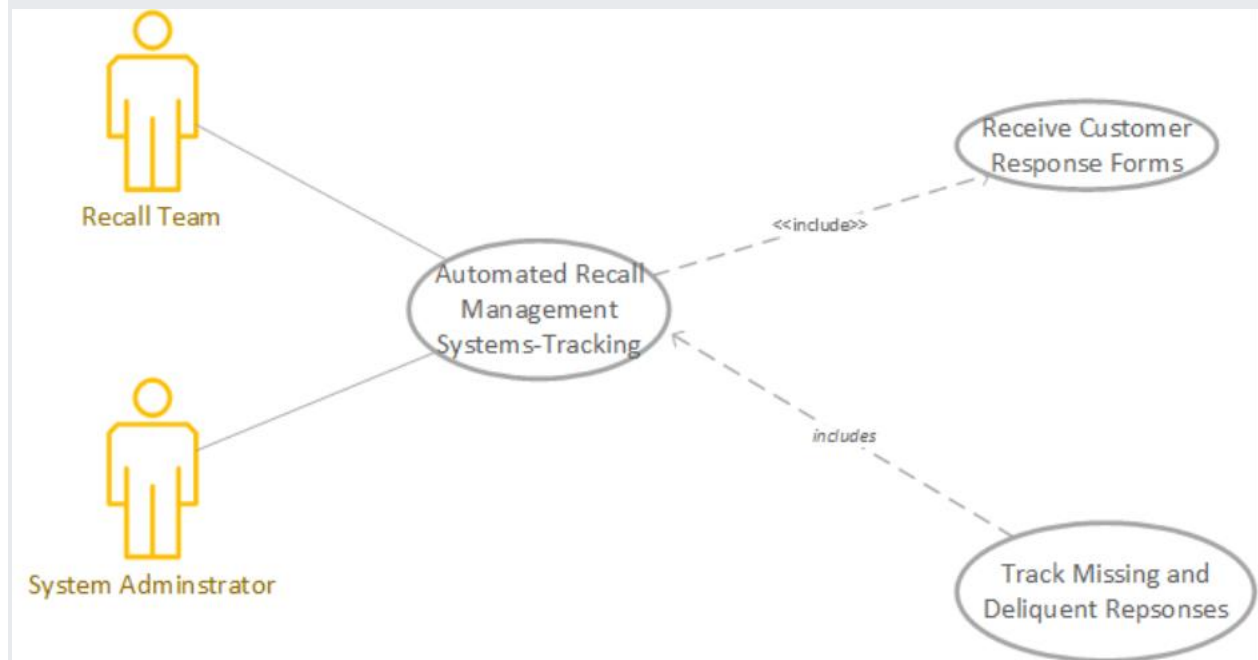

Impact Statement:

The implementation of this system request will ensure that the accessory compatibility requirements are always accurately reflected in the compatibility lists. Currently, there isn't a system that addresses the issues associated with this recall, and given the ever-changing nature of the healthcare landscape, we owe it to our patients and shareholders to implement this system request.
